Problem Statement

XYZ School, offering education in diverse domains such as Arts, Engineering, and Science, faces challenges in evaluating its overall performance. With students from various countries and diverse backgrounds, there is a need for a comprehensive analysis of individual student performance, faculty effectiveness, and financial outcomes.

The school requires a data-driven approach to:

1. Track individual student performance to identify areas of improvement and ensure their academic success.

2. Monitor faculty performance and feedback to uphold teaching quality and student satisfaction.

3. Analyze financial metrics such as profits, student withdrawals to improve profitability and operational efficiency.

The goal is to create visually compelling and actionable reports that provide insights into these areas, enabling informed decision-making for the school's stakeholders.
